PROFESSIONAL SUMMARY

Software Engineer with 5+ years of experience building ML and AI systems end to end, from models and data pipelines to the product and release infrastructure around them. At Google, built ML-driven reserve-pricing models that generated \$10M+ in revenue and extended large-scale MLOps pipelines. Since then, has owned release infrastructure for the Letta desktop app and 0-to-1 engineering for early-stage startups. Skilled in Python, C++, TypeScript, and cloud-native architecture.

EXPERIENCE

Nob Hill Labs - Senior Software Engineer (Contracting for Letta)

Aug 2026 - Present

- Proposed and built a packaged e2e stage for the Letta desktop release pipeline, testing the fully built app users install and gating production promotion on failure.
- Caught a couple of packaging regressions (asar, native modules) the existing e2e suite missed in its first week, including an open user-reported bug; fixed both.

Chelys / HumaniCore - Independent Software Engineer

Mar 2026 - Present

- Owned 0-to-1 engineering for two pre-seed startups, launching chelys.io and humanicore.ai with DNS, GitHub-connected Vercel preview and production pipelines, and initial AWS/Supabase services.
- Built a server-side submission flow in Astro with input scrubbing and rate limiting; advised founders on early technical and product direction.

Datavant - Software Engineer

Sep 2025 - Nov 2025

- Extended an ELT pipeline to support a client-specific schema, including Snowflake loading, database migrations, and intermediate-table transformations, taking the client live on a production searchable database.
- Integrated the new data into the existing customer-matching and heuristic-ranking workflow across Python/FastAPI services, AWS RDS, and Snowflake.

Google - Software Engineer

Oct 2021 - Nov 2024

- Engineered ML-driven reserve-pricing models for sparse auction environments, improving market efficiency and generating 2.5%+ revenue lift (\$10M+).
- Extended large-scale data and MLOps pipelines for deep neural networks using Google's C++ distributed framework, Flume, and TFX; improved accuracy by 10% across new verticals.
- Automated hyperparameter tuning with Google Vizier/Bayesian optimization by creating a simulation pipeline to evaluate model configurations after release, saving 10 developer-hours per cycle.
- Deployed region-specific model architectures, optimizing inference and ad ranking for targeted geographies to maximize click-through rate and revenue.

Ancestry - Associate Software Engineer

Jan 2020 - Oct 2021

- Optimized checkout UX through iterative experiments on component design, improving conversion rates.
- Contributed to over 5% user growth with go-to-market features that enabled users in new international markets.
- Implemented multi-region and multi-language validation, supporting international go-to-market campaigns.

TECHNICAL SKILLS

Languages: Python, C++, SQL, TypeScript, JavaScript

Backend & Data: FastAPI, Node.js, gRPC, Snowflake, AWS RDS

Cloud & Delivery: AWS, GCP, Vercel, Supabase, CI/CD

ML, Frontend & Testing: TensorFlow, TFX, Pandas, scikit-learn, React, Astro, Jest, Cypress

EDUCATION

University of California, Merced | B.S. in Computer Science and Engineering, 2019 | GPA: 3.6 | Dean's Honors
